<https://agrifoodtef.eu/services/valorisation-data-and-assessment-data-space-integration>

Type of Sector

Arable farming, Greenhouse, Horticulture, Tree Crops, Viticulture

Accepted type of products

Data, Design / Documentation

Type of service

Data analysis, Data augmentation

Description

Analysis of collected data in the context of AI agriculture product or service development and opportunities for data-value extraction via integration within the AgrifoodTEF DataSpace. We can help customers understand the value of their data (monetary and not monetary) and channels to offer it to potential users/buyers. By analysing the offer and demand in relevant Data Spaces, we suggest the optimal way to describe metadata and adopt the right technology implementations to make data visible, ensuring data owners never lose control of who accesses their data. The services include consulting customers on the enrichment of their data system to adopt data sovereignty and trust solutions that make them contribute to and be part of the European data space strategy.

How can the service help you

The service allows the customer to explore how they could monetise their data and to be advised about the routes and tools to do that, together with insights into integration opportunities.

How the service will be delivered

This is a digital service, and its duration is approximately 16 weeks, adjustable as needed. The customer provides the data gathered (under NDA) or access to the database. The customer will receive a data value analysis report, recommendations for data integration, and metadata description guidance.

Service customisation

Service customisation is envisaged according to the specific sector tackled.
